

NOTE 14

CobraNet Routing using CobraNet Discovery

This note describes how to use the CobraNet Discovery Utility ("Disco") to perform routing. This note assumes v3.4.2.

1. Install and run Disco once, then close the program.
2. In the same directory that Disco is installed in (should be C:\Program Files\Cirrus Logic\CobraNet Discovery by default), you will find a file called cndisco.ini. It is a standard Windows .ini file and can be edited with WordPad or Notepad. Open this file and find the [Configuration] section. Add this line to the section:

```
CC_Enable=1
```

It is case sensitive so add it exactly as it appears above.

3. Save and close the file.
4. Run disco.
5. When you see the devices on the screen, you can double click on them to bring up the configuration dialog for that device.
6. From there you can click on the Advanced button and also double click on the individual transmitters and receivers to configure them.

<end>
